Title: Bridging the Gap: Integrating Genomic Medicine into Clinical Practice with Nest

Nest is a comprehensive, HIPAA-compliant, software platform that provides a scalable solution for incorporating genomic services in patient care. The software is modular and includes flexible rule engines to identify patients who could benefit from genetic testing, a lab agnostic interface to order genetic testing, receive and store results, and EMR integrated Clinical Decision Support (CDS) generated from the latest guidelines to manage patients longitudinally. Nest also includes a patient engagement tool, the Nest Patient Navigator, for educating and supporting patients undergoing genetic testing or receiving care related to genetic test results.

Nest Genomics was founded by experts in software development passionate about delivering genetic services at scale. The Nest platform was built to ensure that genetic information is effectively utilized in longitudinal patient care. Our core team previously founded and commercialized several companies in this space, most recently Clear Genetics (acquired by Invitae) that developed the first genetic education chatbot platform, GIA™, used by over 1 million patients.

Nest sells to health systems, clinics, patient advocacy group and diagnostic labs. Since incorporating in the last 2 years, we launched in 10 health systems across the US.
