Pheno.AI launched the Human Phenotype Project in 2018 - a global, AI first initiative on a mission to improve human health. We set out to deeply profile over 100 000 participants from multiple counties, over the next 25 years. Utilizing cutting edge technologies, we generate an extensive series of multi-omics, clinical & digital measures of health as well as stored biobank samples for each participant profiled.

To date, > 25 000 participants enrolled and we are soon to launch new cohorts in Japan, the UAE and other regions.

Our datasets are now available to researchers from academia as well as the pharma, biotech & wellness industries.
