

Session title - The Device is No Longer a Device: Convergence in Medical Technology

Talk title – Minimally Invasive IRE for Challenging Tumors

Snipe Medical empowers physicians at the frontline of cancer treatment with our IRE (Irreversible Electroporation) endoscopic ablation catheter system. Designed for the ablation of soft tissues, Snipe offers clinicians a minimally invasive modality, especially versatile for use across a variety of cancer patient populations, as an adjuvant, neoadjuvant or definitive treatment.

Snipe's proprietary sensory capacities help optimize cancer treatment with enhanced electrode positioning, while the non-thermal IRE modality enables streamlined, secure ablation of tumors occurring in locations that were previously challenging, such as near critical structures.

This streamlined approach reduces procedure time, lowers costs, and improves patient experience
